

We define the system services as basic applications that support the IT operation and administration as well as the user's essential activities in an organization and enterprise (and maybe the clients of the enterprises).

There're so many applications used in an enterprise, however the very basic ones are for information exchange, from text to multi media. The essential and classical application for business operation and management is an electronic mail (Email). Nowadays, email is just a fundamental part of a collaboration system. The other functions could be mentioned as data sharing, voice and video calls, business calendar, collaboration group features, ...

Video conference system (VCS) is nearly imperative in the collaboration system. Recently, VCS is used in almost organization and enterprises which have many branches in one country or inter nations. Regular meetings used VCS is a regulation of the government of Vietnam.

The IT system is operated smoothly with high availability and efficiency if its administration and monitor are procedural. Many organizations and vendors standardized the administration processes, provided the enhanced applications and utilities to support the system administration and operation.

IT application could be seen as a service provided to users, including users in the enterprise and the client of the enterprise itself. The satisfaction of users is one important method to measure the investment efficiency on a system or solution. Therefore many enterprises are also interested in applications to support users. Receiving the information from users/clients, resolving the issues, providing necessary information,... in correct, efficient and timely manner are the targets of all service provider including IT services.

The basic IT services in an enterprise are as follow:

Collaboration system
eMail system
Data and information sharing, collaboration group
Multi-media collaboration (VOIP, Video)
Video Conference system
Operation and administration, user support systems
User/identity management/administration
Monitoring system for hardware, software, transmission line,...
Central configuration/administration system
User and operation support systems (IT Service Manager, Call/Contact Center, ...)

• Vendors and Clients
